

Problem

How do I get a core file when a Container crashes?

Solution

The problem is that the default limit for the size of core files is smaller than a typical Container core.

Do the following before starting your container:

- `ulimit -c 1000000000`

To test:

- start a container
- check the PID
- `> kill -SIGSEGV`

You should get the following message in the window where the container runs:

- **segmentation fault (core dumped)**

You can find more details here:

- http://aplawrence.com/Linux/limit_core_files.html
